

Software Description

1 Description of code

This code is used for applying the Ensemble Tangent Linear Model (ETLM) to the Nonorographic Gravity Wave Drag (NGWD) scheme used by the Navy Global Environmental Model (NAVGEM). Description of the code and instructions for running the code are provided in this document. For questions please contact Douglas Allen at douglas.allen@nrl.navy.mil.

1.1 Main ETLM_and plotting codes

Interactive Data Language (IDL) code to calculate ETLM ensembles, create and validate the ETLM, and plot the results. There are three main programs and a number of supporting programs and data files.

[etlm.pro](#) – makes ensembles and calculates the validation

[plot.pro](#) – makes various plots

[plot_schematic.pro](#) – plots schematic diagram of non-orographic gravity wave drag parameters

1.2 ETLM_Code/PARAM

Sample parameter files for driving the ETLM.

[Exp_gwsrc_analinc0_escale=1.0000_nwave=01.txt](#)

[Exp_gwsrc_analinc2_escale=1.0000_nwave=15_ntest=1000.txt](#)

[Exp_gwsrc_gtlm_escale=1.0000_nwave=15_ntest=1000.txt](#)

[Exp_gwsrc_random_escale=1.0000_nwave=15_ntest=1000.txt](#)

1.3 ETLM_Code/GWD

IDL code for running the non-orographic gravity wave drag code.

1.6 ETLM_Code/COVARIANCE

Covariance files used for creating fabricated analysis increments. Naming convention includes the longitude and latitude at which the covariance was calculated. The covariance is based on 600 analysis increments from 0000 UTC on 16 October 2014 to 1800 UTC on 14 March 2015, using 6-hourly increments. These are netcdf files.

2 [How to use the code](#)

2.1 The PARAM file

Most of the options for running etlm.pro are in the parameter file in the PARAM directory. Here is a sample of the contents for the random ensemble with scaling of 1.0000, which includes perturbations with standard deviations of 1 m/s, 1 K, and 1 hPa for zonal wind, temperature, and surface pressure, respectively. Four sample parameter files are provided.

PARAM/Exp_gwsrc_random_escale=1.0000_nwave=15_ntest=1000.txt

```
1200          dt          Time step (sec)
2015031500    dtg         Date-time-group
50           kbmax       Maximum level

1.         ustd        Standard deviation for u for unscaled random incs
1.         vstd        Standard deviation for v for unscaled random incs
1.         tstd        Standard deviation for t for unscaled random incs
1.         pstd        Standard deviation of ps for unscaled random incs
1000        useed       Seed for random perturbations to u
2000        vseed       Seed for random perturbations to v
3000        tseed       Seed for random perturbations to t
4000        pseed       Seed for random perturbations to p
201         cseed0     Seed for stochastic wave generator
1001        fabrinc_seed Random seed for fabricated ensembles
30.         c0_spec     Used for ngwparam eq 2
1.         wgt_spec    Used for ngwparam eq 2
5.         tau_spec    Used for ngwparam eq 2
```

Some of the key variables include:

escale: the scaling of the ensemble

nenenstype: which type of ensemble to use

nensuse: how many ensemble members

nwave: the number of NGWD to be launched

2.2 Setting up etlm.pro

Some of the main options are:

```
starttime=long(2015031500)
endtime=long(2015031500)
inctime2=24
```

These set the times in YYYYMMDDHH to run.

```
filename_all=['PARAM/Exp_gwsrc_random_escale=1.0000_nwave=15_nctest=1000.txt']
```

In this array you can put multiple filenames to run various tests (e.g., different scalings or different ensemble types). But by default the code selects one file. Here are some additional important settings.

```
nmakeensemble=1           ; Choose whether to make the ensemble
nreadensemble=1          ; Choose whether to read the ensemble
nplotens=0               ; Choose whether to plot the ensemble
ncalcvalidation=1       ; Choose whether to calc the validation
nplotvalidation=0       ; Choose whether to plot the validation
nens_to_plot=150         ; Number of ensemble members to plot
nvalidation=2           ; Chooses nsampleall for validation (see below)
nanalincfix=0           ; Remove analinc from the analysis
```

These establish the procedures to be run. The example above makes the ensemble, reads the ensemble, and runs through the validation for nvalidation option 2. The plotting options (nplotens and nplotvalidation) are also available to make plots for every grid point, but this is generally not done, rather plot.pro can be used to make these plots after running etlm.pro.

2.3 Running etlm.pro

Examples of running etlm.pro are provided in Section 3.

2.4 Output from etlm.pro

Output is placed in the following directory.

```
../ETLM_Data/t119174k8b/2015031500/Exp_gwsrc_random_escale=8.0000_nwave=15
```

There is one folder for each grid point that is analyzed. For example the longitude=175, latitude=-79.3 data are in the following directory.

```
lon=175.0_lat=-79.3
```

This contains the following files:

`Settings.txt`

Values of the key settings used for this run

`background_2015031500_lon=175.0_lat=-79.3.idl`

Results from running the background profiles through the NGWD routine

C	FLOAT	= Array[15]	Ground-based phase speed
CSTORE	FLOAT	= Array[15]	Intrinsic phase speed
KBOTS	FLOAT	= Array[1]	Index associated with launch pressure
PB	FLOAT	= Array[1, 74]	Background pressure profile [hPa]
PSB	FLOAT	= 995.133	Background surface pressure [hPa]
TB	FLOAT	= Array[1, 74]	Background temperature [K]
UB	FLOAT	= Array[1, 74]	Background zonal wind [m/s]
UT	FLOAT	= Array[74]	Background zonal wind acceleration [m/s/s]
VB	FLOAT	= Array[1, 74]	Background meridional wind [m/s]
XV	FLOAT	= Array[1]	Term to indicate direction of intrinsic phase speed

`ensemble_2015031500_lon=175.0_lat=-79.3.idl`

Results from running the background profiles through the NGWD routine

C	FLOAT	= Array[2000, 15]	Ground-based phase speed
CSTORE	FLOAT	= Array[2000, 15]	Intrinsic phase speed
KBOTS	FLOAT	= Array[2000]	Index associated with launch pressure
PE	FLOAT	= Array[2000, 74]	Ensemble pressure profile [hPa]
PSE	FLOAT	= Array[2000]	Ensemble surface pressure [hPa]
TE	FLOAT	= Array[2000, 74]	Ensemble temperature [K]
UE	FLOAT	= Array[2000, 74]	Ensemble zonal wind [m/s]
UT	FLOAT	= Array[2000, 74]	Ensemble acceleration [m/s/s]
VE	FLOAT	= Array[2000, 74]	Ensemble meridional wind [m/s]
XV	FLOAT	= Array[2000]	Term to indicate direction of intrinsic phase speed

`ETLM_Validation3_gwsrc_random_escale=1.0000_nwave=15_t119174k8blon=175.0_lat=-79.3_stdev=fixed_nctest=00001000_nstate=wind_shortval.idl`

The validation results

IN_ERROR	FLOAT	= Array[103, 19]	In-sample error for all state variables
IN_ERROR_1D	FLOAT	= Array[19]	Vertically-averaged in-sample error
IN_PERSISTENCE_ERROR	FLOAT	= Array[103, 19]	Persistence error for all variables
IN_PERSISTENCE_ERROR_1D	FLOAT	= Array[19]	Vertically-averaged persistence error
LEV	FLOAT	= Array[74]	All NAVGEM L74 nominal full levels
LMUSE	INT	= 51	Number of vertical levels used
NSAMPLEALL	INT	= Array[19]	Number of ensemble sizes tested
OUT_ERROR	FLOAT	= Array[103, 19]	Out-of-sample error for all variables
OUT_ERROR_1D	FLOAT	= Array[19]	Vertically-averaged out-of-sample error
OUT_PERSISTENCE_ERROR	FLOAT	= Array[103, 19]	Out-of-sample persistence error
OUT_PERSISTENCE_ERROR_1D	FLOAT	= Array[19]	Averaged out-of-sample persistence error
OUT_PERT_SIZE_1D	FLOAT	= Array[19]	Averaged perturbation size
PERT_SIZE	FLOAT	= Array[103, 19]	Perturbation size for all variables

Note that the errors are given as mean squared errors (MSE) of the zonal wind for one time step (dt=1200 s) in units of m^2/s^2 . To convert to root mean squared errors (RMSE) in m/s/day you need to do the following conversion (example using out_error_1d) which is included in plot.pro.

`sqrt(out_error_1d)*86400./dt ; converts from MSE to RMSE in m/s/day`

3 Creating the ensembles

Note that for the control the user can either choose the NAVGEM analysis or the NAVGEM background (i.e., analysis minus the analysis increment). This is set by `nanalincfix` in `etlm.pro`, which is by default set to use the NAVGEM background.

3.1 **Running `etlm.pro` for `analinc2` (a.k.a., Fabricated Analysis Increments) with `escale=1.0000` for 2000 ensemble members**

Start IDL

```
.r etlm
1. Create an ensemble
1. FAI: PARAM/Exp_gwsrc_analinc2_nwave=15_nctest=1000.txt
1 (scaling value)
```

Output is in `../ETLM_Data/t119174k8b/2015031500/Exp_gwsrc_analinc2_escale=1.0000_nwave=15`

3.2 **Running `etlm.pro` for `random` (a.k.a., Uncorrelated Noise) with `escale=1.0000` for 2000 ensemble members**

Start IDL

```
.r etlm
1. Create an ensemble
2. UN: PARAM/Exp_gwsrc_random_nwave=15_nctest=1000.txt
1 (scaling value)
```

Output is in `../ETLM_Data/t119174k8b/2015031500/Exp_gwsrc_random_escale=1.0000_nwave=15`

3.3 **Running `etlm.pro` for `gtlm` (a.k.a., Numerical Jacobian) with `escale=1.0000` for 2000 ensemble members**

Start IDL

```
.r etlm
1. Create an ensemble
3. NJ: PARAM/Exp_gwsrc_gtln_nwave=15_nctest=1000.txt
1 (scaling value)
```

Output is in `../ETLM_Data/t119174k8b/2015031500/Exp_gwsrc_gtln_escale=1.0000_nwave=15`

3.4 **Running `etlm.pro` for `analinc0` (a.k.a., Analysis Increments) with `escale=1.0000` for 2000 ensemble members**

Start IDL

```
.r etlm
1. Create an ensemble
4. AI: PARAM/Exp_gwsrc_analinc0_nwave=15.txt
1 (scaling value)
```

Output is in `../ETLM_Data/t119174k8b/2015031500/Exp_gwsrc_analinc0_escale=1.0000_nwave=15`

4 Running the validation

For the validation, the user can either validate with the same sample set or use another set. Here are some examples.

4.1 Validating analinc2 with escale=1.0000 using the same sample set

Start IDL

```
.r etlm
2. Run the validation
1. FAI: PARAM/Exp_gwsrc_analinc2_nwave=15_nctest=1000.txt
1 (scaling value)
1. gwsrc_analinc2_escale=1.0000_nwave=15
2. 100,110,120,...,200,300,...,1000
```

4.2 Validating random with escale=1.0000 using analinc2 with escale=1.0000

Start IDL

```
.r etlm
2. Run the validation
2. UN: PARAM/Exp_gwsrc_random_nwave=15_nctest=1000.txt
1 (scaling value)
1. gwsrc_analinc2_escale=1.0000_nwave=15
2. 100,110,120,...,200,300,...,1000
```

4.3 Validating gtlm with escale=1.0000 using analinc2 with escale=1.0000

Note: here we need to choose option 3 for the validation with 103 members.

Start IDL

```
.r etlm
2. Run the validation
3. NJ: PARAM/Exp_gwsrc_gtlm_nwave=15_nctest=1000.txt
1 (scaling value)
1. gwsrc_analinc2_escale=1.0000_nwave=15
3. 103
```

4.4 Validating random with escale=1.0000 using analinc0 with escale=1.0000

Note: here we need to choose option 4 for the validation.

Start IDL

```
.r etlm
2. Run the validation
1. FAI: PARAM/Exp_gwsrc_analinc2_nwave=15_nctest=1000.txt
1 (scaling value)
4. gwsrc_analinc0_escale=1.0000_nwave=15
4. 100,110,120,...,200,300,...,1000 (use for analinc0 validation)
```

5 Plotting the results

5.1 Plotting the gravity wave parameters

This plots the gravity wave parameters for 2015031500 along with an example of the source spectrum.

Start IDL

```
.r plot_schematic  
2015031500  
../ETLM_Data/FIGURES/NGWD_parameters_2015031500.ps
```

5.2 Plotting the ensemble at one location.

This plots the ensemble background zonal wind (black), ground-based phase speed (blue) and acceleration (red) converted to m/s/day for a chosen grid point. The user needs to specify the PARAM file that is used. An example plot is given below for FAI with escale=1.0000.

Start IDL

```
.r plot
1. FAI: PARAM/Exp_gwsrc_analinc2_nwave=15_nctest=1000.txt
1 (scaling factor)
1. Plot ensemble at one location
175 175.000
10 -79.2786
../ETLM_Data/FIGURES/ETLM_Physics_Ensemble_gwsrc_analinc2_escale=1.0000_nwave=15_t119174k8blon=17
5.0_lat=-79.3_nensuse=00002000_c.ps
```

5.3 Plotting the ETLM matrix at one location

Start IDL

```
.r plot  
1. FAI: PARAM/Exp_gwsrc_analinc2_nwave=15_nctest=1000.txt  
1 (scaling factor)  
2. Plot ETLM at one location          plotetlm  
175      175.000  
10      -79.2786  
18      1000 (ensemble size)  
2. Pick the min/max  
-0.02 0.02
```

```
../ETLM_Data/FIGURES/LETLM_Raster_t119174k8b_expid=gwsrc_analinc2_escale=1.0000_nwave=15_nvaruse=  
0103_nensuse=00002000_lon=175.0_lat=-79.3_minus1_cool.ps
```

5.4 Plotting the validation at one location

These examples are for the UN with `escale=1`, validated against the same sample set.

Start IDL

```
.r plot
2. UN: PARAM/Exp_gwsrc_random_nwave=15_nctest=1000.txt
1 (scaling factor)
3. Plot validation at one location
2 (validation option)
2. gwsrc_random_escale=1.0000_nwave=15
175      175.000
10      -79.2786
```

This creates several figures. First, Vertically-averaged RMSE [m/s] versus ensemble size. Here black is out-of-sample error, red is in-sample error, and blue is persistence error.

```
../ETLM_Data/FIGURES/ETLM_Validation_RMSE_gwsrc_random_escale=1.0000_nwave=15_t119174k8blon=175.0
_lat=-79.3_stdev=fixed_nctest=00001000_nstate=wind.ps
```

The percent error versus ensemble size. Black is out-of-sample, red is in-sample.

```
../ETLM_Data/FIGURES/ETLM_Validation3_gwsrc_random_escale=1.0000_nwave=15_t119174k8blon=175.0_lat=-79.3_stdev=fixed_nctest=00001000_nstate=wind_shortval_RMSE_Percent.ps
```

Profiles of errors in units of m/s/day. Dashed (solid) is persistence (out-of-sample) error.

../ETLM_Data/FIGURES/ETLM_Validation_RMSE_msecday_gwsrc_random_escale=1.0000_nwave=15_t119174k8bl
on=175.0_lat=-79.3_stdev=fixed_nctest=00001000_nstate=wind.ps

Profile of percent errors

../ETLM_Data/FIGURES/ETLM_Validation_Percent_gwsrc_random_escale=1.0000_nwave=15_t119174k8blon=175.0_lat=-79.3_stdev=fixed_nstest=00001000_nstate=wind.ps

t119174k8b lon=175.0 lat=-79.3

Nsample = 1000

5.5 Plotting the validation at all locations

Here we plot the validation results at all grid points. User chooses the ensemble size and the vertical weighting option. Here we show results for FAI validated against the same sample set.

Start IDL

```
.r plot
1. FAI: PARAM/Exp_gwsrc_analinc2_nwave=15_nctest=1000.txt
1 (scaling)
4. Plot validation at all locations plotmult
1. gwsrc_analinc2_escale=1.0000_nwave=15
2 (validation option)
18 1000 (ensemble size)
3. Thickness weighting, use 1 hPa and up
../ETLM_Data/FIGURES/ETLM_Validation_Plot_PERS_ETLM_ERROR_gwsrc_analinc2_escale=1.0000_nwave=15_v
al_gwsrc_analinc2_escale=1.0000_nwave=15_00001000.ps
```
